《算法图论实验》上机实践报告

课程名称： 算法图论实验	**年级：** 2015 级	**上机实践成绩：**
指导教师： 李建平	**姓名：** 刘鹏	**专业：** 信息与计算科学
上机实践名称： 编程实现图搜索算法	**学号：** 20151910042	**上机实践日期：** 2018-10-16
上机实践编号： 1	**组号：**	

一、 实验目的

1. 理解广度优先搜索算法的具体步骤；
2. 学会读开源的代码库，并逐步学会使用这些代码库完成扩展性的实验。

二、 实验内容

1. 用形式化伪代码表示图的广度优先搜索算法；
2. 借助开源代码库，完成高质量的广度优先搜索算法编程。

三、 实验平台

Windows 10 Pro 1809；
Cygwin GCC, G++编译器；

四、 算法设计

本次理论课上所讲的 Searching 算法在图论中一般被称为广度优先的图遍历算法（Breath First Searching, BFS）。在一定规则下循环地使用这个算法可以对一个图进行遍历，并得到所有的连通子图（连通分支）。这个算法十分重要，它是 Dijkstra 算法以及更一般的 Prim 算法的基础与原型。下面对 Searching 算法（广度优先图遍历算法）进行形式化描述。

Algorithm 图的反圈遍历算法，记此算法为SEARCH
Input 图$G=(V,E)$，并假定图G是无向图；
图G中的某个起点v

Output 自v_1出发所有有路可到达的点以及路过的边所构成的诱导子图，记之为ε-CLOSURE $=$ SEARCH$(G,\ v_1)$
Begin

Step 1 // 初始化染色
for each vertex $u \in (V-\{v\})$:
$u.\mathbf{color}=\mathbf{White}$
$u.\mathbf{d}=\infty$
$u.\boldsymbol{\pi}=\mathrm{NIL}$

Step 2 // 初始化给定的起点

$v.\mathbf{color} = \mathbf{Gray}$

$v.\mathbf{d} = 0$

$v.\boldsymbol{\pi} = \mathrm{NIL}$

$Q = \emptyset$

$\mathrm{ENQUEUE}(Q,\ v)$

Step 3 **while** $Q \neq \emptyset$:

$u = \mathrm{DEQUEUE}(Q)$

for each vertex $x \in \boldsymbol{\Phi}_G(u)$:

if $x.\mathbf{color} == \mathbf{White}$:

$\mathrm{ENQUEUE}(Q,\ x)$

$x.\mathbf{color} = \mathbf{Gray}$

$x.\mathbf{d} = u.\mathbf{d} + 1$

$x.\boldsymbol{\pi} = u$

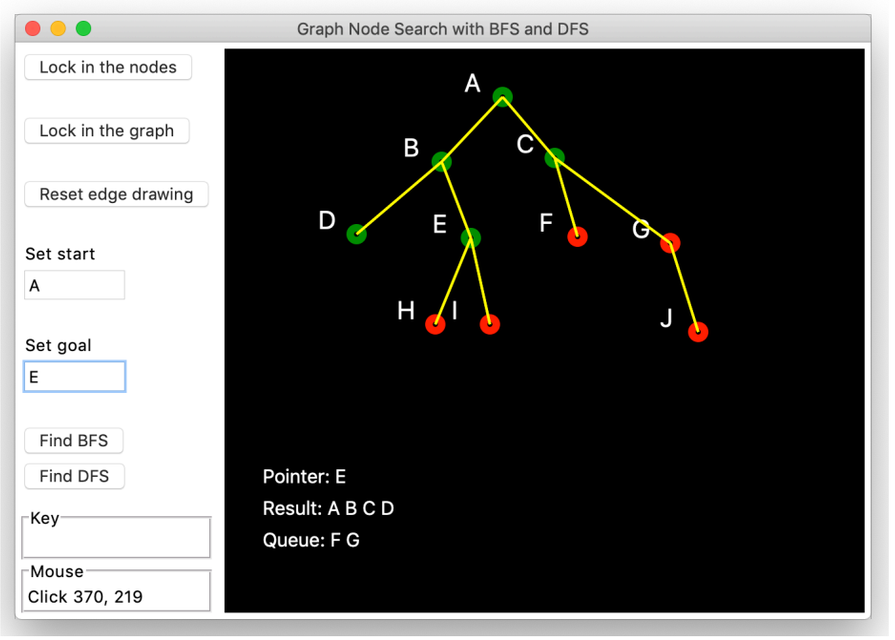
$u.\mathbf{color} = \mathbf{Black}$

End

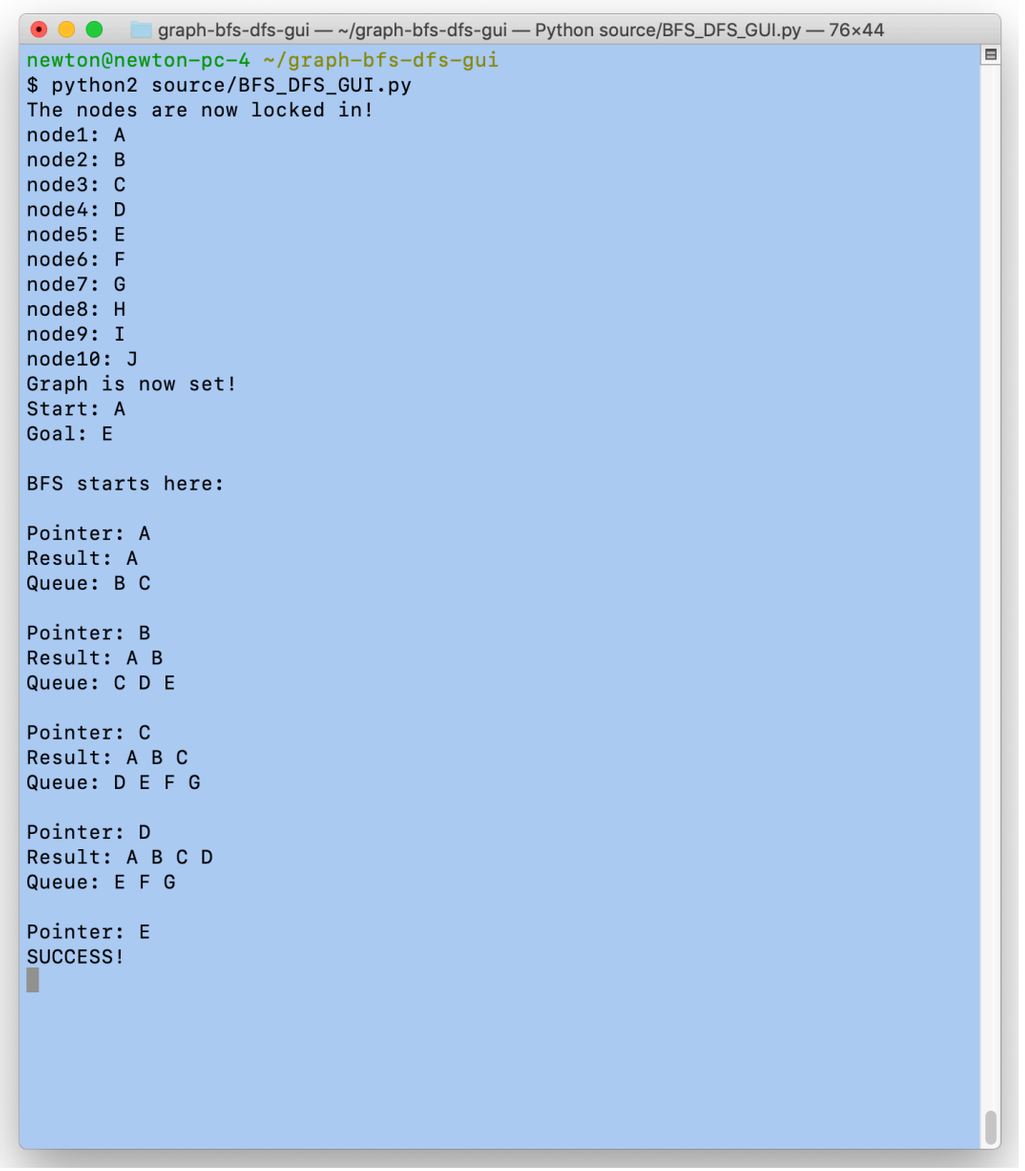
根据这个算法，可以很快写出图的极大连通分支搜索算法SUB-GRAPH(G)、图的连通性判断算法IS$-$CONNECTED(G)等。

五、 程序代码

由于染色的时候，黑白色在白底纹的显示屏上很不突出，而把底纹改成其他颜色的话纸质打印有会出现涂抹现象，所以代码中把染色变为了具有高对比度的红绿色。



可以在下图中看出，求 A 到 E 的路时，队列有如命令行中所示的变化。



5.1 程序代码

由于 C 语言的 GUI 代码库太复杂，这里采用 Python 的 simpleGUItk 进行编程。核心语言还是 Python 2。

```
